

Solutions for Panelized Walls

Speeding construction with less labor

The construction of off-site wall panels is increasing in frequency. Contractors, Architects and Owners are seeing the benefits to quality and schedule by reducing the impact of weather and labor constraints on site. But what about windows and doors? Pella can provide solutions to maximize the benefits of panelized walls while avoiding the issues associated with shipping windows in the panels. One solution is the utilization of Pella's Receptor installation system. With this system, the receptor and sill flashing components can be installed in the panel facility. This allows the critical flashing steps to be completed in a controlled environment and reduces on site labor. After the panels are on-site the windows can be installed quickly with a dry-gasket seal.
